CHAPTER TWO
OPERATION
Introduction

About the operation of the panel

Use of intelligent and addressable detectors and modules provide the operator with precise information on the location of the alarm or trouble, as well as what type of device is reporting the activity.

**WARNING**

The AM2020/AFP1010 control panel will only operate with Notifier intelligent addressable devices installed.

All operating power, as well as data communications to and from intelligent and addressable devices, is transmitted on a two-wire LIB Signaling Line Circuit (SLC) Loop that may be wired to meet the requirements of either NFPA Style 4 (Class B) or Style 6 or 7 (Class AA) operation. The AM2020 system can be configured with up to 10 LIB SLC Loops and the AFP1010 system with up to 4 Loops, each of which is capable of supporting up to 99 intelligent detectors and up to 99 addressable control or monitor modules.

A **fire alarm** in the AM2020/AFP1010 is initiated by activation of any of the following devices:

- Intelligent smoke or heat detectors (SDX-551/751, SDX-551-TH, CPX-551/751, FDX-551, or IPX-751, etc.).
- Conventional normally-open or normally-closed contact fire alarm initiating devices connected to addressable MMX Monitor Modules (or equivalent XPM circuits) along a LIB SLC Loop.

During an alarm condition, LEDs on as few as six and as many as 99 addressable initiating devices (smoke detectors, heat detectors, MMX modules etc.) and/or output modules may be latched on. A latched-on LED on an initiating device indicates that the device has caused an activation signal to be transmitted to the AM2020/AFP1010. A latched on LED on an output module indicates that the module has been activated. An **activation signal** on the AM2020/AFP1010 includes fire alarms, security alarms, supervisory conditions, or non-alarm inputs.

**NOTE**

During loss of primary (AC) power, when the AM2020/AFP1010 is operating under secondary power, only LEDs on intelligent detectors (including DHX-501 duct detectors) will be latched on during a fire alarm.

**CAUTION**

The AM2020/AFP1010 can be programmed to latch the LEDs on up to 99 addressable devices (MMX, CMX, etc.). This software feature can be used only if ALL installed addressable devices are stamped with the code R4 on the product marking label (purchased from Notifier after April 1, 1991.) Use of this feature under any other circumstances can cause the LIB SLC Loops to shut down during a fire alarm condition. RA-400 Remote LEDs are not permitted for use with this feature (excluding those wired to DHX-501 Duct Detectors). Use only the RA-400Z Remote LED when extending the number of latched-on LEDs beyond six. SDX-551 Photoelectric Detectors can also have an H code after their model numbers.

**NOTE**

Detectors have priority over modules. Detectors that come into alarm will assume LED-latch priority over previously-latched module LEDs.

Output devices (alarm notification appliances, output relays, etc.) are controlled by activation of CMX Control Modules (or equivalent XPC or XPR circuits) connected along the LIB SLC Loop. A control module may serve as a Form-C output relay or as a Notification Appliance Circuit (NAC).

About this Chapter

This chapter covers the operation of the AM2020/AFP1010 Combination Fire/Security Protective Signaling System and the control features available to the operator presented through the perspective of the Display Interface Assembly (DIA-2020 or DIA-1010).
Following are general terms used for specific part numbers:

- PRN is used for PRN-4
- CRT is used for CRT-2
- CMX is used for CMX-1 or CMX-2
- MMX is used for MMX-1 or MMX-101

This chapter refers to CMX Control Modules and MMX Monitor Modules. If XP Series Transponders are used, unless otherwise stated, the following substitutions may be made:

- MMX Monitor Modules can be substituted with XPM circuits.
- CMX Control Modules configured as Form-C contacts (tabs broken), can be substituted with XPR circuits.
- CMX Control Modules not configured as Form-C contacts can be substituted with XPC circuits.

NOTE
See warning regarding XP Transponder operation at the beginning of Chapter Three, Section Three. For more information, refer to the XP Series Transponder System Manual.

About the passwords
The AM2020/AFP1010 functions in one of three levels—Operational Level, Level One, and Level Two. In Operational mode, the operator may perform the following keypad or menu-displayed functions:

- Acknowledge alarms, troubles, and restorations (clears)
- View acknowledged alarms, troubles, and restorations
- Silence the sounding of fire alarm notification appliances
- Reset the AM2020/AFP1010 System
- Test all intelligent addressable detectors in the system
- Test the panel's LED indicators, Liquid Crystal Display (LCD), terminal and printer
- Read the status of the entire AM2020/AFP1010 system, including the addressable devices
- Print out a report on the status of the system or access the history buffer

Access to keypad or menu levels one and two require entry of specific passwords. These levels allow an authorized programmer to initialize or alter the programming of the AM2020/AFP1010. Level One and Level Two entry requirements are defined as follows:

Alter Status ___________________ Level One password required.
Programming___________________ Level Two password required.

If the main operator of the system requires access to a function which is password protected, contact the distributor who installed the system for the required password(s). For more information on programming or altering the status of the AM2020/AFP1010, refer to Chapter Three of this manual.

Whenever the operator selects a menu, the AM2020/AFP1010 begins a one-minute timer. If no key is pressed during this minute, the function selected will be aborted and control will return to the state the panel was in prior to selection of that menu.

NOTE
Unacknowledged points must be acknowledged prior to being reprogrammed. Any new trouble or alarm reports reviewed during programming may disrupt the programming process.

About the software
Depending on the particular release of software in your system, some menu functions and system features may not be operable. If you attempt to execute a function not operable, the panel will respond with the message "FUNCTION NOT ENABLED."
About addresses
For certain functions such as READ STATUS, the operator must enter a device, software zone, or annunciator point address. Leading zeroes are not required. The address assumes the following format:

LXX (D/M) YY, ZXXX or AXXPYY

For example, L3M44 must be entered as the address for the 44th module on LIB SLC Loop 3.

About the Backspace Key
The backspace key serves two purposes:

1) At a menu prompt:

The backspace key "aborts" the selection of that menu.

2) When entering data or making a selection from a menu:

the backspace key erases the last character, or menu choice entered.
About entering alphanumerics
Most of the keys on the DIA keypad serve more than one function. For instance, the 3 key is used to enter the digit 3 or the letter D when entering the address of a detector.

The AM2020/AFP1010 toggles which character is displayed on the LCD with each successive keypress of that same key. This allows the operator to press a particular key until the desired character is displayed. That character is entered into the display whenever the next, different, key is pressed. If two of the characters contained on a particular key (for instance, the D and the 3) need to be entered in succession, the ALPHA ENTER key must be used (see example that follows). After the full address has been entered into the display, press ENTER to transfer the display contents to the system for processing.

Example: To enter L8D3,

Press and the letter K will be displayed.

Press again and the K will change to L.

Press and the letter O is displayed to the right of the displayed letter L.

Press again to change the letter O to the digit 8.

Press and the letter D will be displayed to the right of the displayed characters L8. The partial address displayed now reads L8D.

Press to enter the letter D into the display.

Press and a second letter D will be displayed to the right of the displayed characters L8D. The partial address displayed now reads L8DD.

Press again to change the second D to the digit 3. The completed address now reads L8D3.

Press to transfer the display contents to the AM2020/AFP1010 system for processing.

About Walk Test
The Walk Test function is a service feature that allows one-man testing of devices on any selected LIB. The Walk Test feature will automatically abort after 15 minutes of inactivity if inadvertently left enabled by the service representative.
About the display time
The AM2020/AFP1010 has a separate time field in the display for each event that occurs in the system.

All Systems Normal: During periods of no activity, the time field reflects the current time. For AM2020/AFP1010 systems with NOTIFIRE•NET™, the time is synchronized every hour by the network master clock (last AM2020/AFP1010, INA, or NRT node on network to have its time changed).

Single, unacknowledged event: When an event has occurred but has not been acknowledged, and no other event has occurred, the CRT terminal and the DIA display the time this event occurred.

Multiple, unacknowledged events: The display will show the actual time that the first unacknowledged event occurred. After the first event is acknowledged, the time shown on the display does not represent the time at which the event occurred, but instead indicates the time at which the event is displayed.

Single/multiple previously acknowledged events: The time shown for an acknowledged event is the time at which that event was last placed in the display by activation of the ack/step key (not the time at which the event occurred).

About the print time
Output from the printer for a particular event (alarm, trouble, acknowledgment, etc.) includes the time the event was sent to the printer, which, in most cases, is identical to the time the event occurred. In extreme cases, when many events have occurred within a few seconds, the time printed for a particular event may differ from the actual event time by up to one minute. After events have been acknowledged, only the event history buffer (if enabled) and the system printer will provide a record of the time at which events occurred.

About priorities
Every event the AM2020/AFP1010 displays is prioritized. This includes the processing of incoming alarm and trouble events, acknowledging events, the clearing of events, and acknowledging the clearing of events (receiving unit operation only). Security alarms will increment the trouble counter on the terminal status line of the CRT.

NOTE
Security alarms are processed like fire trouble conditions in the AM2020/AFP1010.

The AM2020/AFP1010 processes and displays events under the following priorities, highest priority first:

1) Fire Alarms 8) Cleared Fire Alarms
2) Security Alarms 9) Cleared Security Alarms
3) Supervisory Signals 10) Cleared Supervisory Signals
4) Device Troubles 11) Cleared Device Troubles
5) Disabled Zones 12) Cleared Disabled Zones
6) System Troubles 13) Cleared System Troubles
7) Annunciator Troubles 14) Cleared Annunciator Troubles

In addition, detectors have a higher priority than modules within each detector/module category; the lower the address, the higher the priority (see list below). The display of certain events can be pre-empted by others at the time they are acknowledged. Pay careful attention to the display when acknowledging events.

Node 1, Loop 1 Detector 1, Loop 1 Detector 2, Loop 1 Detector 3 … Loop 10 Detector 99
(followed in priority by)
Node 1, Loop 1 Module 1, Loop 1 Module 2, Loop 1 Module 3 … Loop 10 Module 99
(followed in priority by)
Node 1, Zone 1, Zone 2, Zone 3… Zone 240
(followed in priority by)
Node 1, System Trouble Indices (in Hex) T00, T01, T02… TFF
(followed in priority by)
Node 1, Annunciator Trouble Indices (in Hex) N00, N01, N02… NFF
About System Test
System Test, or "Detector Test" as it is often referred to, is a manually initiated test of all intelligent detectors installed in the system. When the user presses the system test key the fire panel performs a chamber test of each intelligent detector to ensure its proper operation. System test can take up to one minute before displaying its results. There are two types of display:

![Detector Test: All OK](image1)

Each LIB displays the total number of intelligent devices installed on it, as well as the overall system total.

![Detector Test Fail](image2)

Each failed device is represented by a three digit number. The first digit indicates the LIB number (0=10), and the last two the device address. If more than ten devices have failed a "+" is shown after the last detector number. If more than ten detectors failed, the serviceman would have to repair, replace or disable the ten listed, and then rerun System Test in order to locate the remaining ones.

About Periodic Test
The fire panel performs a periodic automatic chamber test of all intelligent detectors installed in the system to ensure their proper operation. When a detector has failed its automatic chamber test, it will generate a trouble message as in Section 5.1 with "DET FAILED TEST" in the type of trouble field. The service man would then have to repair or replace the indicated device.
Section One
The Display Interface Assembly

Section 1.1 Normal Operation

During normal fire alarm operation when no alarms or troubles exist, the system will display the following:

Custom 40-Character User Label

NOTIFIER A PITTWAY COMPANY
ALL SYSTEMS NORMAL 04:32P 03/01/97

Current Time and Date
Hour:Minute Month/Day/Year

The operator can perform the functions associated with the following keys without having to enter a password:

READING STATUS

ACK STEP

SIGNAL SILENCE

SYSTEM RESET

SYSTEM TEST

LAMP TEST

(a description of the READ STATUS and the SPL FUNCT keys follows)
**AC POWER** - A green LED will illuminate to indicate that the system is operating from the primary power supply.

**FIRE ALARM** - A red LED will flash to indicate that the panel has detected at least one fire alarm in the system. The red LED will light steadily when all fire alarms have been acknowledged. The panel display will provide detailed information about each alarm received.

**TROUBLE/SECURITY ALARM** - A yellow LED will flash to indicate any unacknowledged change of status in the system. The panel display will provide detailed information about each change of status signal received. After all change of status conditions have been acknowledged, and while at least one trouble condition still exists, the Trouble/Security Alarm LED will illuminate steadily. Note: Security alarms are treated as fire trouble conditions in this combination fire alarm/security system.

**DISPLAY TROUBLE** - A yellow LED will illuminate when a trouble condition is detected in the display assembly. If this LED is illuminated the contents of the display must be considered invalid. **Call your service representative immediately.**

**SIGNAL SILENCE** - A yellow LED will illuminate steadily when all the control modules that can be silenced have been silenced. A flashing yellow LED indicates a partial signal silence condition (some of the control modules that can be silenced have been silenced.)

**ACK STEP** - This key is used to acknowledge system alarm or trouble conditions. When depressed, the operator acknowledges the new status of the device indicated on the display. Depression of this key will also step the display to the next device in alarm or trouble. After all such system alarm and trouble conditions have been acknowledged, the ACK STEP key may be used to step the display through the existing system alarm and trouble conditions.

**SYSTEM RESET** - This key is used to clear all system alarm and trouble conditions. If an alarm or trouble condition still exists after System Reset, that alarm/trouble condition will resound. **Note:** The function of this key is inhibited until all alarms and troubles have been acknowledged.

**SYSTEM TEST** - This key is used to automatically perform a test of all intelligent detectors in the system. Results of the system detector test are then indicated on the panel display.

**LAMP TEST** - This key is used to perform a test of LEDs on the control panel and to test the panel display. The test will illuminate the panel LEDs in sequence for a timed period and flash the panel display. When the test has been completed, the panel LEDs and the panel display will return to their prior status.

**NOTE** - These keys and their functions are repeated on the alphanumeric keypad of the DIA.

**PIEZOE CRYSTAL DISPLAY** - The DIA LCD displays the current status of the entire AM2020/AFP1010 system. While programming the AM2020/AFP1010, the LCD provides various system configuration menus and prompts. This display also is illuminated when the AM2020/AFP1010 is under AC power. The display will remain illuminated for one minute after the loss of AC power; any keypad or system activity will re-illuminate the display for one minute.

**80 CHARACTER LIQUID CRYSTAL DISPLAY** - The LCD displays the current status of the entire AM2020/AFP1010 system. While programming the AM2020/AFP1010, the LCD provides various system configuration menus and prompts. This display also is illuminated when the AM2020/AFP1010 is under AC power. The display will remain illuminated for one minute after the loss of AC power; any keypad or system activity will re-illuminate the display for one minute.

**ACK STEP** - This key is used to acknowledge system alarm or trouble conditions. When depressed, the operator acknowledges the new status of the device indicated on the display. Depression of this key will also step the display to the next device in alarm or trouble. After all such system alarm and trouble conditions have been acknowledged, the ACK STEP key may be used to step the display through the existing system alarm and trouble conditions.

**SYSTEM RESET** - This key is used to clear all system alarm and trouble conditions. If an alarm or trouble condition still exists after System Reset, that alarm/trouble condition will resound. **Note:** The function of this key is inhibited until all alarms and troubles have been acknowledged.

**SYSTEM TEST** - This key is used to automatically perform a test of all intelligent detectors in the system. Results of the system detector test are then indicated on the panel display.

**LAMP TEST** - This key is used to perform a test of LEDs on the control panel and to test the panel display. The test will illuminate the panel LEDs in sequence for a timed period and flash the panel display. When the test has been completed, the panel LEDs and the panel display will return to their prior status.

**NOTE** - These keys and their functions are repeated on the alphanumeric keypad of the DIA.
Section 1.2 Read Status

The Read Status feature of the AM2020/AFP1010 allows the operator to display the status of the entire system. To execute READ STATUS:

Press

The display will show:

```
PRESS 1=SYS, 2=PTREAD, 3=ALM, 4=TBL, 5=DIS,
       6=MONON, 7=CTLO
```

Enter 1 for Display System Configuration. This selection provides information on any of the system parameters programmed into the AM2020/AFP1010 - the number and style of the Loop Interface Boards, the AVPS-24s and APS-6Rs, the Software Zone Boundary, the system time delays, annunciator modules installed, etc.

Enter 2 for Point Read. This selection provides information on the status of any intelligent detector, addressable module, software-defined zone or annunciator point in the system.

Enter 3 for Alarm. This selection provides information on the lowest addressed device or zone in a fire alarm state.

Enter 4 for Trouble. This selection provides information on the lowest addressed device or zone in trouble.

Enter 5 for Disable. This selection provides information on the lowest addressed device or zone disabled.

Enter 6 for Monitor On. This selection provides information on the lowest addressed non-fire or security monitor module activated.

Enter 7 for Control On. This selection provides information on the lowest addressed control module activated.

NOTES

Read Status options 3, 4, 5, 6, and 7 use the same format as the Point Read option to display their indicated point information.

For an AM2020/AFP1010 FACP on the NOTI•FIRE•NET system, programming and read status operations should always be performed from a Network Reporting Terminal (NRT).

Never attempt to perform programming or read status operations from a local panel when the NRT is simultaneously attempting to do so.
Selecting 1 from the Read Status Menu allows the operator to review the various system parameters entered into the AM2020/AFP1010. The System Configuration Menu:

**Enter Menu Choice:**

**Status Displayed:**

1. **THESE LIB BOARDS ARE INSTALLED:**
   
   \[1=Y, 2=Y, 3=Y, 4=Y, 5=N, 6=N, 7=N, 8=N, 9=N, 10=N\]

   \[Y=installed\quad N=not\text{\ installed}\]

2. **THE SLC LOOP STYLES ARE AS FOLLOWS:**

   \[1=6, 2=6, 3=6, 4=6, 5=4, 6=4, 7=4, 8=4, 9=4, 10=4\]

   The default value for SLC Loops not installed is NFPA Style 4

3. **VER=60, SIL=045, CUT=0000**

   \[VER = \text{Alarm Verification Time} \quad \text{(in seconds)}\]

   \[SIL = \text{Signal-Silence Inhibit Time} \quad \text{(in seconds)}\]

   \[CUT = \text{Signal Cut-out Time} \quad \text{(in seconds)}\]

4. **THERE ARE CURRENTLY 04 AVPS-24 INSTALLED IN THE SYSTEM**

**NOTE:** The number “04” in the above display represents the total number of AVPS and/or APS-6R power supplies installed in the system.
## Enter Menu Choice: Status Displayed:

### 5

<table>
<thead>
<tr>
<th>ZONES 001 - 200 ARE FORWARD ACTIVATED</th>
</tr>
</thead>

</tbody>
</table>

TS = Is the connection to the terminal supervised? (If TS=N, the terminal will not audibly indicate state changes [i.e., no Bell characters will be sent]).

SL = Is the Status Line option enabled?

APM = Is the connection to the auxiliary printer monitored?

CMR = Is control module state reporting enabled?

NAR = Is “NONA”/“NOA” monitor module state reporting enabled?

LEDL = LED latches on more activated addressable devices?

PEC = Continue to transmit under printer error conditions?

BC = Is bidirectional copy enabled?

PTI = Is the primary printer trouble inhibited?

RPT = Are printer reports directed to terminal output?

### 7

<table>
<thead>
<tr>

<td>ABCD</td>
<td>71</td>
<td>RC</td>
</tr>
</tbody>
</table>

DPZ = Is the piezo disabled during programming?

LMD = Local Mode detector address.

LMM = Local Mode monitor module address.

LMC = Local Mode control module address.

72A = Protected premises fire alarm system.

72B = Auxiliary fire alarm service.

72C = Do not use (see Chapter 2, section 1.1.7)

72D = Do not use (see Chapter 2, section 1.1.7)

71 = Do not use (see Chapter 2, section 1.1.7)

RC = Proprietary supervising station or central station receiving unit.

BTYP = Type of battery installed in the system.

BCAP = Ni-cad battery capacity.

BSBY = Ni-cad battery standby time.

ERM = Is event reminder enabled?

BLN = Is device blinking enabled?

PAL = Is pre-alarm option enabled?

### 8

**PRESS 1=INSTL, 2=ANN, 3=XINT, 4=DACT:**

Option 8 provides you with a Read Status sub-menu for viewing the status of the intelligent SIB, installed annunciators, external interface, or DACT. This menu is described on the next page.

### 9

<table>
<thead>
<tr>
<th>HIZNDET=2150, LOZNDET=2001, DVTCNTR=15</th>

</tr>
</tbody>
</table>

HIZNDET = High zone for day/night detector sensitivity.

LOZNDET = Low zone for day/night detector sensitivity.

DVTCNTR = Detector verification trouble counter limit.

SER = Is “SACM”/“SEQM” monitor module state reporting enabled?

DFT = Is drift compensation enabled?

PGR = Is PAGE-1 enabled?

MDM = Is modem enabled?

NAM = Is the NAM-232 enabled?

RP = Is rapid polling enabled?

SUP = Is supervisory ACS reporting enabled?
Menu Choice 8:

Enter Option Choice:  Status Displayed:

1  ISIB=Y

ISIB = Is the Intelligent Serial Interface Board installed?

**NOTE**

ISIBs available for the AM2020/AFP1010 system include the SIB-2048A and SIB-NET. For an AM2020/AFP1010 connected to a NOTI•FIRE•NET™ system however, the only ISIB that can be used is the SIB-NET. If a SIB-NET is not installed, NOTI•FIRE•NET™ specific functions can not be programmed or read under Read Status (see Chapter One).

2  THESE ANNUNCIATORS ARE INSTALLED:  (PRESS ENTER TO CONTINUE UNTIL DONE)

Due to its size, the Annunciator Read Status display is separated into two screens, illustrated below. Pressing <ENTER> invokes the next display.

3  UPDN=N, ADDR=010, DBID=BC00D148
   MIBA=H, MIBB=H, PORTS=2

   UPDN = Is the ACS Port upload/download enabled?
   * ADDR = FACP NOTI•FIRE•NET™ address.
   * DBID = Database identifier.
   * MIBA = MIB-W/WF threshold for Channel A. (On the MIB-WF, only the Channel A threshold setting is used.)
   * MIBB = MIB-W threshold for Channel B.
   * PORTS = Number of data ports monitored.

   * These items are NOTI•FIRE•NET™ specific functions and are only displayed when a SIB-NET is installed.

4  DACT=01

   DACT = Base address of the UDACT (blank for none installed).
Selecting 2 from the Read Status Menu allows the operator to review the various detector, module, software zone or annunciator point parameters entered into the system. The system prompts the operator for the address of the point to be read:

```
ENTER LXX(D/M)YY, ZXXX OR AXXPYY FOR PT.
STATUS (BCKSPC TO ABORT) :
```

Upon entering the address, the system will display a distinct screen format, depending on the particular type of device being read, as illustrated below:

**NOTE**

After a one-minute timeout, the Control-By-Event (CBE) and the annunciator point mapped address is displayed for devices and zones. Cooperative Control-By-Event (CCBE) is displayed for reverse zones. To display this information immediately, press ENTER after the status line appears.

### Detectors

Status: **DISABL, ALARM, TROUBL, NORMAL.**

Software Type I.D. 20-Character Custom Label

<table>
<thead>
<tr>
<th>Status</th>
<th>Software Type I.D. 20-Character Custom Label</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal Smoke (ION)</td>
<td>COMPUTER ROOM SMOKE</td>
</tr>
<tr>
<td>SH V000 H 034</td>
<td>L02D26</td>
</tr>
</tbody>
</table>

**Detector Verification**

If verification is enabled for this point, the V indicator appears and the 3-digit counter shows the number of times the verification timer was activated for the point without going into alarm. The counter returns to zero when power is cycled to the IFC-1010/2020 or by following the procedure in the *Resetting Sensor Verification Counters* section of this document. If you disable verification, the counter will retain its last value. If verification is not enabled for this point, the V indicator does not appear; however, the 3-digit number still appears. Note that the counter does not increment unless verification is enabled.

**NOTE**

A detector may be in periodic test during a read status. In this case, the detector status will be normal but the percentage of alarm threshold will be greater than 100%. If this happens, wait one minute, then perform another read status.
Control Modules

*A REQUEST status indicates that a telephone off-hook (ring-in) signal has been received and answered by the operator at the fire fighter telephone ACS switchboard, but has not been connected to the telephone line.

**Special Status**

Option 3 provides information on devices or zones in a fire alarm state. Option 4 provides information on devices or zones in a trouble state. Option 5 provides information on disabled devices or zones. Option 6 provides information on activated non-fire or security monitor modules. Option 7 provides information on activated control modules. Selecting 3, 4, or 5 from the Read Status Menu prompts the operator to choose between zones and devices. The following example performs a search for the lowest device in a fire alarm state.

```
PRESS 1=SYS, 2=PTREAD, 3=ALM, 4=TBL, 5=DIS, 6=MONON, 7=CTLON : 3

DO YOU WANT ZONE OR DEVICE STATUS? (Y=ZONE, N=DEVICE (BCKSPC TO ABORT)) : N

ALARM: SMOKE(ION) COMPUTER ROOM SMOKE A M 034 L02D26
```

**NOTE**

The control-by-event and the annunciator point mapped address is displayed for devices and zones after a one minute timeout. In a NOTI•FIRE•NET system, cooperative control-by-event equations are displayed for reverse zones. To display this information immediately, press ENTER after the status line appears.
Section Two
Prior/Next/Auto Step

The Prior, Next, and Autostep keys are used in conjunction with options 2 through 7 of the Read Status Menu. Upon selection of one of these options an address range is defined by the AM2020/AFP1010 for which similar searches can be performed using the Prior, Next and Autostep Keys. These functions enhance and speed up the search process, because they eliminate having to re-enter the Read Status Menu for the same function being repeated.

**PRIOR** - Searches the database in a reverse direction from the current address (refer to note).

**NEXT** - Searches the database in a forward direction from the current address (refer to note).

**AUTOSTEP** - Performs an automatic search of the database in the forward direction from the current address with a two second display of status line, followed by a two second display of the CBE and annunciator point mapped address, for each of the points found. (The CCBE equation is displayed for reverse zones on the NOTI•FIRE•NET system.)

**NOTE**
The control-by-event and the annunciator point mapped address is displayed for devices and zones after a one minute timeout. The cooperative control-by-event is displayed for reverse zones. To display this information immediately, press ENTER after the status line appears.

Starting Search Address  \[
\mathbf{\text{PRIOR}} \quad < \text{Current Address} > \quad \mathbf{\text{NEXT / AUTOSTEP}} \quad \text{Ending Search Address}
\]

The Autostep key can be used as an alternate method for generating special reports.
Section Three
Special Function

The Special Function feature of the AM2020/AFP1010 allows the operator to generate AM2020/AFP1010 status reports or view the AM2020/AFP1010 History Buffer.

Press the display will show:

PRESS 1=RPTS, 2=HIS

Enter 1 for a System Configuration report, 2 for an Installed Point report, 3 for a Fire Alarm report, 4 for a Trouble report, 5 for a Disable report, 6 for a Monitor Module On report (including non-fire and security monitor modules), or 7 for a Control Module On report.

The display will show:

PRESS 1=SYS, 2=POINT, 3=ALM, 4=TBL, 5=DIS, 6=MONON, 7=CTLON

Enter 1 to execute the report or 2 to abort a report already in progress.

NOTE

Only one report can be conducted at any one time. The reports are not displayed on the DIA. Reports are either displayed on the CRT and/or printed by the printer depending on whether or not printer reports are redirected to the CRT during programming. An example of a report printout is illustrated in Figure 3-1.
The special function report printouts (refer to Figure 3-1) assume the same display format as the Point Read option under Read Status. For a description of the various report fields, refer to Point Read.

Note: APS-6Rs will be counted as AVPSs in the Special Function Report Printout.
The History Buffer

Menu Option 2

READ STATUS

Press 1 = Print, 2 = Display, 3 = Step, 4 = Range/Status

Choices 1, 2, and 3 will prompt the user for the beginning and end of the History Buffer range. The maximum number of events that the system can save in the History Buffer is 400.

Enter "1" to produce a printed report of the History Buffer. An example of a History Buffer printout is illustrated in Figure 3-2.

Enter "2" to perform an automatic display of the History Buffer on the DIA and CRT terminal (if employed).

Enter "3" to perform a manual display of the History Buffer on the DIA and CRT. Use the ENTER key (on DIA) or RETURN key (on CRT) to advance the display.

Enter "4" to display the History Buffer range (the number of entries contained in the buffer), and current status (active/inactive).
To differentiate between history buffer printouts (refer to Figure 3-2) and system printouts, the colon (:) in the time field has been replaced by the semicolon (;).

Figure 3-2 AM2020/AFP1010 Special Function History Buffer Printout

Section 4.1 Acknowledging a Fire Alarm

To acknowledge a fire alarm condition at the panel:

Push ACK STEP and the ALARM: device status will change to ACK AL (Acknowledged Fire Alarm).

When the fire alarm condition clears (either automatically in the case of devices programmed for Tracking, or by depression of the SYSTEM RESET key), the panel will display CLR AL and the piezo will resound. To acknowledge the clearing of a fire alarm:

Push ACK STEP and the CLR AL status will change to ACL AL (Acknowledged Clear Fire Alarm).

When multiple events have occurred, the system will display the first event that occurred (with the exception that the first fire alarm will always override any previous trouble). When the ACK STEP key is pushed, the operator will have acknowledged the highest priority event, not necessarily the event that is being displayed on the CRT Monitor and DIA. The acknowledged message for the first prioritized event will be displayed for several seconds, followed by display of the next priority unacknowledged event.

NOTES
- The piezo sounder will be silenced only after all events have been acknowledged.
- Security alarms are treated like fire trouble conditions in the AM2020/AFP1010.
- Reset the system using the System Reset Key after all alarms have been investigated and subsequently cleared.
- Alarm signals from devices not selected for tracking need a system reset in order to clear.

For an AM2020/AFP1010 panel on the NOTI•FIRE•NET system, acknowledgment of any event may be accomplished from the local fire alarm panel, intelligent network annunciator (INA), or network reporting terminal (NRT). Acknowledging alarms and events from any of these locations automatically provides acknowledgment at all locations. Fire alarm signals are acknowledged individually at the local fire alarm panel, NRT, or INA. If the same event on the same point occurs on multiple nodes, the event on the node with the lowest node address has the highest priority. For more information on priorities and acknowledging events on the NOTI•FIRE•NET system, refer to the INA Manual, Document 15092, or the NRT Manual, Document 15090.
Section Five
Troubles

Section 5.1 Trouble .................. with SLC Loop Devices

The following example illustrates the format used to display device trouble conditions:

Device Type:

Detectors:
- FIXED PHOT D
- FIXED THER D
- HEAT(ANALOG)
- ION DUCT DET
- SMOKE (ION)
- SMOKE ION HP
- SMOKE ION LP
- SMOKE(COMBO)
- SMOKE(PHOTO)

Modules:
- ACCESS MONTR
- ALARMS PEND
- AREA MONITOR
- CMX CONTROL
- CMX FORM C
- CONTROL
- DACT CONNECT
- EQUIP MONITR
- FORMC MANUAL
- FORM C RELAY

- SPRVSRY MNTR
- SYSTEM MONTR
- TELEPHONE
- TRBL MONITOR
- TRBLS PEND
- TROUBLE
- TROUBLE FORC
- WATER FLOW

Device Address
in the range 01-99.

Software Zone
The first zone that the
device was mapped to
during programming.

Custom Device Label
that was entered during
programming.

Device Status

Time and Date
Hour:Minute Month/Day/Year

Loop Number
in the range 1-9,
with 0=Loop 10.

Type of Trouble:

For Detectors:
- DET FAILED TEST
- DEVICE DISABLED
- DRIFT TOLERANCE
- INVALID REPLY
- LOW CHAMBER VAL
- MAINTENANCE REQ
- PRE-ALARM ALERT
- VER COUNT OVFLW

For Modules:
- DEVICE DISABLED
- INVALID REPLY
- OPEN CIRCUIT
- POINT TROUBLE
- SECURITY ALARM
- SECURITY ALERT
- SECURITY NO COM
- SECURITY TAMPER
- SHORT CIRCUIT
- SPRNKLR TROUBLE
- SPRVSRY SIGNAL

NOTE
The piezo sounder will sound steadily for unacknowledged trouble conditions.
Section 5.2 Trouble .................. with Disabled Zones

The following example illustrates the format used to display disabled zone trouble conditions:

![Diagram of disabled zone trouble conditions]

Device Status

Device Type:
FORWARD ZONE
REVERSE ZONE

Custom Zone Label that was entered during programming.

TROUBL FORWARD ZONE  FIRST FLOOR
ZONE DISABLED        04:32P 03/01/97Z001

Zone Address

Z001-Z240.

Type of Trouble
(Fixed)

Time and Date
Hour:Minute Month/Day/Year

NOTE
The piezo sounder will sound steadily for unacknowledged trouble conditions.
Section 5.3 Trouble ..........................with the AM2020/AFP1010 System

The following example illustrates the format used to display system trouble conditions. For an explanation of some trouble messages, refer to Section Seven.

![Example of Trouble Display](image)

Device Status
Specific Trouble Message

Time and Date
Hour:Minute Month/Day/Year

Trouble Index
Provide this index to your Notifier Representative for troubleshooting.

NOTE
The piezo sounder will sound steadily for unacknowledged trouble conditions.

Section 5.4 Trouble ..............................with the Annunciators

The following example illustrates the format used to display trouble conditions with the Annunciator Control System modules. For an explanation of some trouble messages, refer to Section Seven.

![Example of Annunciator Display](image)

Device Status
Annunciator Module
Specific Trouble Message

Custom Annunciator Label
User defined during programming.

Time and Date
Hour:Minute Month/Day/Year

Trouble Index
Provide this index to your Notifier Representative for troubleshooting.
Section 5.5 Block Acknowledge

The function of block acknowledge gives the user the ability to acknowledge multiple trouble conditions with a single depression of the ACK STEP key. The AM2020/AFP1010 block acknowledge function is normally enabled. With block acknowledge enabled, the AM2020/AFP1010 will function as follows:

- Fire Alarm conditions including clears (tracking devices only) must be acknowledged individually as described on the preceding pages. Fire Alarm conditions restored by depression of the system reset key do not require acknowledgment.
- All current unacknowledged conditions must be processed by the system before block acknowledge is executed (events will be acknowledged individually until then).
- No acknowledged event messages are recorded for individual troubles once the block acknowledge message has been displayed.
- Trouble clears will be recorded for individual troubles that have not been initiated by a system reset.
- Trouble clears no longer have to be acknowledged.
- Troubles may come and go without being acknowledged.
- Upon completion of block acknowledge the AM2020/AFP1010 will enter its display acknowledged events mode of operation (see displaying current alarms and troubles section).

To disable the block acknowledge function, refer to the local parameters NFPA programming section in Chapter Three of this manual. If the AM2020/AFP1010 block acknowledge function is disabled, the AM2020/AFP1010 will process alarm and trouble conditions in Receiving Unit Mode as described on the preceding and following pages respectively. See caution note below for restrictions.

Push

<table>
<thead>
<tr>
<th>ACK</th>
</tr>
</thead>
<tbody>
<tr>
<td>STEP</td>
</tr>
</tbody>
</table>

to execute block acknowledge. The following message will appear:

```
********** BLOCK ACKNOWLEDGE **********
04:32P 03/01/97
```

**CAUTION**

For an AM2020/AFP1010 connected to a NOTI•FIRE•NET system which also includes an NRT or an AFP-200 panel, receiving mode is not supported and block acknowledge should not be disabled. Disabling block acknowledge in this situation will prevent the panel from functioning properly and alarms will not be acknowledged.

If no NRT or AFP-200 is present on the network, the AM2020/AFP1010 may be configured for receiving mode or block acknowledge, provided that all other nodes (INAs, AM2020/AFP1010s) on the system are configured in the same manner.
Section 5.5A Acknowledging Troubles in Receiving Unit Mode
(Block Acknowledge Disabled)

The receiving unit mode of operation is required for all NFPA proprietary supervising station and central station receiving units.

To acknowledge a device, zone, system or annunciator module trouble condition:

Push \[\text{ACK STEP}\] and the TROUBL status will change to ACK TB (Acknowledged Trouble).

When the trouble condition clears, the panel will display CLR TB and the piezo will sound again. To acknowledge the clearing of a trouble condition:

Push \[\text{ACK STEP}\] and the CLR TB status will change to ACL TB (Acknowledged Clear Trouble).

When multiple events have occurred, the AM2020/AFP1010 will display the first event that occurred (with the exception that the first fire alarm will always override any previous trouble). When the ACK STEP key is pushed, the operator will have acknowledged the highest priority event, not necessarily the event that is being displayed on the CRT Monitor and DIA. The acknowledged message for the first prioritized event will be displayed for several seconds, followed by display of the next priority unacknowledged event.

**NOTE**
The piezo sounder will be silenced only after all events have been acknowledged.

Section 5.6 Displaying Current Alarms and Troubles

To display alarms and troubles that have been acknowledged but not cleared:

Push \[\text{ACK STEP}\] and the next event in AM2020/AFP1010 memory will be displayed on the LCD. All events in memory can be reviewed by repeated depression of the ACK STEP key.
The AM2020/AFP1010 will support the installation of optional remote Video Display Terminals and printers.

**The CRT Terminal**
The CRT displays all system information. The CRT can also display system reports if printer reports are redirected to the CRT during programming. The CRT is provided with a keyboard that can be used to program the AM2020/AFP1010.

**Local Applications**
The keyboard can be used to operate the AM2020/AFP1010 provided the keyboard is either removed or locked up when not in use.

**Receiving Unit Applications**
If employed under NFPA 72-1993 Proprietary Fire Alarm System (Receiving Unit) applications, the keyboard cannot be removed or locked up. The keyboard must remain connected and operationally functional in the system.

**The Printer**
The printer can be used to provide a permanent record of all system events. Alarms, troubles, and acknowledgments are recorded as they occur in the system. In addition, the printer can be used to print out status information and system reports.
Section Seven
Trouble Messages

Many of the AM2020/AFP1010 device, zone, system and annunciator trouble messages are self-explanatory. Those messages needing further clarification are listed below. If the system is displaying a message that is not self-explanatory, and is not listed here, contact your Notifier distributor.

CAT. COMM. FAULT
Catastrophic communications failure - the annunciator associated with this message is no longer functioning. The connection may be broken.

CAT. FAIL. INCOMPATIBLE SOFTWARE
OR INVALID CBE
The panel is operating under an earlier version of software after newer software features have been programmed into the system. Contact the factory to establish valid software compatibility. Complete reprogramming of system CBE equations may be required.

CATASTROPHIC LOOP INTERFACE BOARD
"X" COMMUNICATION FLT
Communication has failed between the AM2020/AFP1010 and the LIB Board specified in the "X" field of the message. This failure may be due to several reasons: the LIB Board has failed electronically; the LIB Board is programmed but not installed in the system; the LIB Board is installed but is not programmed into the system; or a poor connection has been made between the CPU and the LIB Board.

COMMUNICATION LINK FAILURE IN PORT A*
Data is not being received on network (MIB) Port A. This trouble is only reported if the node is configured for dual port monitoring.

COMMUNICATION LINK FAILURE IN PORT B*
Data is not being received on network (MIB) Port B. This trouble is only reported if the node is configured for dual port monitoring.

DET FAILED TEST
This detector failed its periodic detector test. The periodic detector test verifies the alarm operation of the detector. This trouble will also be generated when non NOTIFIER devices are detected on the SLC. The detector should be removed and replaced by an authorized service representative.

DRIFT TOLERANCE
This detector's drift compensation value is outside the allowable range. This detector can no longer be compensated and should be replaced.

EXPANDER MODULES
The number of annunciator expander modules for this annunciator is less than the number indicated by its DIP switch settings.

EXT EQP ANN "XX" OR AUDIO/TELEPHON
External equipment connected to the trouble contacts of an annunciator, AMG or FFT-7 has failed.

INSTALL. ERROR
Installation error with an Annunciator Control System module. An annunciator has been physically installed in an AM2020/AFP1010 system, but has not been programmed; or has been programmed, but not installed.

INVALID REPLY
The AM2020/AFP1010 has received either no response or an invalid response from an addressable LIB SLC Loop device. Confirm that the LIB SLC Loop is connected properly to the device and that the device address has been set correctly.

LAN COMMUNICATION FAILURE*
The specific network node (panel) can no longer communicate with the rest of the network, indicating a problem with the network connections.
LOW CHAMBER VAL
The chamber value of the detector is too low for operation. This indicates a malfunction in the detector. The
detector must be removed and replaced by an authorized service representative.

MAINTENANCE REQ
The chamber value of the detector has exceeded 80 percent of the Alarm Threshold (determined by the
sensitivity selection of Low, Medium, or High), and has remained there for at least a 26-hour period. This
condition may be due to a dirty detector. The detector should be inspected and cleaned as necessary by an
authorized service representative. Failure to do so may eventually result in false alarms.

MANUAL CONTROL
This annunciator is being controlled manually.

PRE-ALARM ALERT
The chamber value of the detector has exceeded 80% of the alarm threshold (determined by the sensitivity
selection of Low, Medium or High), and has remained there for at least a 60-second period. This condition
may be due to a dirty detector. The detector should be inspected and cleaned as necessary by an authorized
service representative. Failure to do so may eventually result in false alarms.

POINT TROUBLE
A monitor module dedicated to monitoring trouble conditions has been activated.

SECURITY ALARM
A security device programmed as SARM has been activated indicating a burglary or security violation. This
condition should be checked immediately.

SECURITY ALERT
A security device programmed as SACM has been activated indicating that a monitored event has occurred.

SECURITY TAMPER
A security device programmed as SSYM or SEQM has been activated indicating that monitored equipment
has been tampered with. This condition should be checked immediately for a SSYM device because it may be
due to a burglary or security violation.

SECURITY NO COM
The AM2020/AFP1010 has received either no response or an invalid response from an addressable SLC loop
device programmed for security operation. This may be the result of a burglary, other security violation, the
failure of a device, an improperly addressed device, or failure of the field wiring.

SPRNKLR TROUBLE
A supervisory condition that indicates sprinkler equipment supervised by a monitor module is in an abnormal
state (i.e. a sprinkler valve has been closed). Note that a break in the wiring of a supervisory circuit is a
trouble condition that yields OPEN CIRCUIT, not SPRNKLR TROUBLE.

SUPRVSRY SIGNAL
A supervisory condition that indicates equipment supervised by a monitor module is in an abnormal state (i.e.
low pressure indication). Note that a break in the wiring of a supervisory circuit is a trouble condition that
yields OPEN CIRCUIT, not SUPRVSRY SIGNAL.

VER COUNT OVFLW
This detector has exceeded the allowed detector verification limit. This condition may be due to a dirty
detector. The detector should be inspected and cleaned as necessary by an authorized service
representative. Failure to do so may eventually result in false alarms.

* NOTIFIRE•NET*-specific trouble messages
Section Eight
Drift Compensation

Drift Compensation
AM2020/AFP1010 software is designed to automatically compensate for chamber sensitivity drift due to detector contamination in SDX-551/751 photo detectors and CPX-551/751 ion detectors. This software-based compensation meets NFPA 72-1993, Chapter 7 “Inspection, Testing, and Maintenance” periodic sensitivity testing and maintenance requirements without removing and testing each smoke detector in an installed system. This does not eliminate the need for visual inspection or testing for smoke entry.

Alarm sensitivity in a detector chamber tends to increase over time. This increase is caused by chamber contamination. In time, if the clean air level exceeds the alarm threshold a false alarm occurs. Drift compensation eliminates this problem by increasing the alarm threshold as needed to maintain constant sensitivity. When the detector is too dirty to compensate, a trouble is indicated automatically.

No additional programming is required for drift compensation. Every detector has three sensitivity levels: low, medium, and high. These levels assign specific "percent obscuration per foot" values for each device.

<table>
<thead>
<tr>
<th></th>
<th>Low Sensitivity (% obscuration per foot)</th>
<th>Medium Sensitivity (% obscuration per foot)</th>
<th>High Sensitivity (% obscuration per foot)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Photo Detector</td>
<td>2.0</td>
<td>1.5</td>
<td>1.0</td>
</tr>
<tr>
<td>Ion Detector</td>
<td>3.0</td>
<td>1.5</td>
<td>1.0</td>
</tr>
</tbody>
</table>

Drift compensation is executed when:

- The system powers up.
- A non-communication INVALID REPLY clears.
- Every 120 hours based on at least four samples.

Whenever a detector is replaced, an immediate compensation must be forced. The installer should remove the existing detector, wait for at least three minutes, and then install the new detector.

After servicing a system containing drift compensation software, some detectors may cause a drift compensation trouble indication within 15 minutes after reapplication of power. These detectors may have undergone several drift sensitivity adjustments in the past and may not be properly compensated during power up compensation. A second compensation may be required before the trouble condition clears. This second compensation will be completed automatically after 120 hours. If a trouble condition for a detector still exists after a second compensation, clean and/or replace it.

If power has not been removed and reapplied recently and drift compensation trouble is indicated for a particular device, clean and/or replace the detector immediately.
